

The Doctor is In

Your medical home for advanced urologic and cancer care.

Optimized care in an efficient, cost-effective, patients-come-first environment defines the profile of Dayton Physicians Network, a multifaceted practice that grew to meet the needs of the community.

“We are physician owned and managed, and we are proud to say our autonomy gives us the ability to bring the highest level of service to our patients,” says board-certified medical oncologist/hematologist Dr. Charles Bane, President of Dayton Physicians Network.

Raising the Standards

Dayton Physicians Network has established an unprecedented level of cancer care responsiveness in the Miami Valley. The goal is to reduce medical costs by helping patients stay out of the hospital and under the care of the doctors who are most familiar with their case—thus eliminating stress and unnecessary testing.

“As part of the Oncology Medical Home Initiative [medicalhomeoncology.org], we are helping raise the standards of cancer care,” explains

Charles L. Bane, MD

David W. Key, MD

E. Ronald Hale, MD, MPH

Dr. Bane. “We have established urgent care appointment availability, we are here seven days a week and in the evenings, and we have a triage phone line where patients can talk to a nurse at any time.”

Continuum of Care

“Our urology group treats all urologic conditions, but by being part of this multidisciplinary practice, we can be with our patients—including those with prostate and other urologic cancers—from diagnosis through all aspects of their journey,” says board-certified urologist Dr. David Key.

The practice’s direct involvement with nationally based research studies as well as ongoing collaboration with colleagues who refer all other types of cancer patients to the practice means disease-specific care is being achieved at its highest level.

“We’ll be here for you when you need us most,” confirms Dr. Key.

TrueBeam™ STx
Fast. Powerful.
Noninvasive.

“The installation of this latest-generation technology gives us the ability to offer the best and fastest noninvasive cancer treatments available today—right here in our own community. That’s a huge plus for patients,” notes board-certified radiation oncologist Dr. Ronald Hale.

The TrueBeam accelerator provides finely focused, customized treatment planning for radiation therapy and radiosurgery. Its precision means previously difficult-to-treat tumors in the lung, brain, and liver are more accessible, and good outcomes for patients are on the rise.

“This dynamic technology, along with an arsenal of other cancer treatment tools, means our reach has been extended,” says Dr. Hale. “Now, patients who have cancer that cannot be cured can often have great disease control and live many years with excellent quality of life.”
